Inverted UN Scale of Assessments Formula (IUSAF)

Working Paper on Option A

Paul Oldham[1]

I. Introduction

This paper presents an option for the funding allocation formula for the Cali Fund established under the United Nations Convention on Biological Diversity (decision 16/2). The paper was developed to support the deliberations of the Ad-Hoc Technical Expert Group on Allocation Methodology to design an allocation formula for consideration by COP17 to be held in Armenia in 2026. This paper proposes a simple, transparent, and easy to communicate allocation formula consisting of three components:

1. The United Nations Scale of Assessments is used to set the annual budget contributions of member states to the core UN budget based on their economic capacity. The proposed formula inverts the Scale of Assessments by arranging Parties into six bands. Parties in lower bands, consisting of developing countries, Least Developed Countries (LDCs) and Small Island Developing States (SIDS), receive more from the Cali Fund than Parties in higher bands based on their assessed contribution to the United Nations budget. This is the foundation or equity base of the allocation model.[2] This is formally expressed by naming the formula the Inverted United Nations Scale of Assessments Formula (IUSAF).

The biogeographic characteristics of Parties mean that some Parties face greater biodiversity stewardship challenges than other Parties. Two additional components are adjustments or *overlays* on this foundation that recognise the different biodiversity stewardship responsibilities that exist between Parties. These are:

2. A SIDS Ocean Stewardship Component (SOSAC) that recognises the costs associated with the ocean stewardship responsibilities of the 39 Parties who are recognised as Small Island Developing States (SIDS)[3] within the United Nations system.[4]
3. A Terrestrial Biodiversity Stewardship Component (TSAC) that recognises the costs associated with the terrestrial biodiversity stewardship responsibilities of Parties, notably for middle-income Parties with large terrestrial areas in implementing their National Biodiversity Strategies and Action Plans (NBSAPs) and associated National Biodiversity Finance Plans.[5]

[1] Paul Odham is the Director of One World Analytics and served as a member of the Ad-Hoc Technical Expert Group on Allocation Methodology.
[2] This is based on indicative Criteria C with economic capacity as the proxy.
[3] https://www.un.org/ohrlls/content/about-small-island-developing-states
[4] This responds to indicative Criteria A with SIDS status as the proxy for marine biodiversity.
[5] This responds to indicative Criteria A with land areas (sq. km) as the proxy for biodiversity richness

Indigenous peoples and local communities have received specific recognition by Parties as beneficiaries of the Cali Fund.[6] The IUSAF formula treats the allocation to indigenous peoples and local communities as integral rather than additional to the allocation model. This is achieved by dividing the nominal country share evenly between government and indigenous peoples and local communities components on the country level. An allocation is also provided for indigenous peoples and local communities in nine developed countries.

Allocation and disbursement are related but distinct topics. Distinguishing between allocation and pathways to disbursement will allow for flexibility in approaches to disbursement at different scales of the Cali Fund. In accordance with decision 16/2 the IUSAF formula is predicated on allocations on a country level. However, the approach also recognises that disbursements could be made on the United Nations region, sub-region and intermediate region level, as appropriate. Recognition of the distinction between allocation and disbursement allows for consideration of the priorities set out in NBSAPS and National Biodiversity Finance Plans, where available, and flexibility in the identification of appropriate pathways to disbursement for indigenous peoples and local communities.

The outcome of the modelling exercise is a human readable formula that can be easily and simply expressed to communicate with different audiences as follows:

Country Share = economic capacity + biodiversity stewardship

OR:

Country Share = Inverted UN Scale + Terrestrial Stewardship + Ocean Stewardship

OR with acronyms:

Country Share = IUSAF + TSAC + SOSAC

OR using mathematical symbols for TSAC (β) and SOSAC (γ):

$$\text{Country Share}_i = (1-\beta-\gamma) \times \text{IUSAF}_i + \beta \times \text{TSAC}_i + \gamma \times \text{SOSAC}_i$$

In plain English the formula can be described in simple terms such as:

> "Allocations from the Cali Fund are based on a combination of recognition of a country's economic capacity and biodiversity stewardship responsibilities. The vital role of indigenous peoples and local communities in conservation and sustainable use is recognized in all allocations."

OR in more detail:

> "Allocations from the Cali Fund are based on the UN Scale of Assessments that is used to determine country contributions to the United Nations core budget. The UN Scale is inverted to ensure that developing countries and least developed countries receive the largest share from the Cali Fund. In addition, the allocation formula

[6] See paragraph 21 of the annex to decision 16/2

> recognises the challenges presented by the different ocean and terrestrial biodiversity stewardship responsibilities of Parties. The Cali Fund recognizes the vital role of indigenous peoples and local communities, and they receive at least 50% of Cali Fund allocations."

The ocean and terrestrial stewardship overlay components (SOSAC and TSAC) are in tension with the Inverted UN Scale equity base because the percentage shares awarded to them *reallocate funds from the equity base*. If Parties accept the Inverted UN Scale as the foundation for the allocation formula the key question for Parties will be determining the appropriate percentage shares for the SOSAC and TSAC components.

Determining the appropriate percentage shares for the stewardship components involves a policy choice that can only be made by Parties: it is not a technical question. However, technical analysis can assist Parties with identifying potential balance points. In depth sensitivity analysis reveals that the key policy choice is determining the percentage share for the TSAC component. Three balance points are presented for potential consideration, they are:

Strict: The IUSAF equity base is dominant for all eligible Parties without exception. Stewardship supplements never exceed the equity base for any Party. TSAC is set at 1.5% and SOSAC at 3%.

Gini-minimum: The point at which the Gini coefficient is lowest while preserving IUSAF band order. At this setting the IUSAF band hierarchy is preserved at the level of the band-mean, but for the Party with the largest terrestrial land area (China, TSAC/IUSAF ratio 1.40) TSAC exceeds IUSAF. TSAC = 2.5%, SOSAC = 3%.

Band-order boundary: The structural ceiling at which the descending band order of allocations - where no higher number band can receive more than a lower numbered band - is just overturned: Band 6 mean allocation ($5.74M) marginally exceeds Band 5 ($5.70M). TSAC ≈ 3.0%, SOSAC = 3%.

In considering these balance points it is important to appreciate the volume of funds that are being allocated under the Inverted UN Scale and the stewardship pool. Under a US$1 billion fund 94-95.5% ($940-955m) will be stably allocated under the IUSAF. The amount under consideration for allocation under the three balance point scenarios is 4.5-6.0% of the Cali Fund or $45-60 million. Under these scenarios for 142 developing country Parties 73% of eligible Parties would see reallocations of less than $0.5 million ($500,000) and 6 (4%) would see reallocations of $1 million or more. As such, if IUSAF is accepted by Parties as a stable baseline, the question for consideration by Parties on a projected $1billion fund would be how to allocate the $45-60 million stewardship pool. The size of the stewardship pool will scale in accordance with the overall size of the Cali Fund.

The allocations discussed in this paper are purely illustrative and allow for the transparent and evidence-based exploration of inversion of the UN Scale and recognition and testing of biodiversity stewardship components. The purpose of the illustrations is to allow Parties to assess the implications and trade-offs involved if such a formula was to be adopted.

The approach taken in the development of this option for the allocation formula is grounded in paragraphs 17-21 of the annex to decision 16/2 and in two of the indicative criteria set out in Enclosure II of the annex to the same decision. The indicative criteria are Criteria C on capacity needs using economic capacity as the proxy, and Criteria A) on biodiversity richness and other biodiversity-related criteria using United Nations status as Small Island Developing States (SIDS) and terrestrial land area as proxies.

The paper concludes by proposing that any future elaboration of the formula could potentially combine the Inverted UN Scale with refinement of the stewardship components through the creation of a *Biodiversity Stewardship Index*. The development of such an index may be subject to the improved availability of robust data that is transparent to Parties in accordance with Target 21 of the Kunming-Montreal Global Biodiversity Framework and associated indicators.

II. Datasets and Data Availability

The approach to the formula deliberately avoids the use of complex indices and uses well-established and well-understood datasets from within the UN system as follows:

1. The UN Scale of Assessments (currently 2025-2027);[7]
2. The United Nations Statistical Division *Standard country or area codes for statistical use* (M49 Standard). This includes LDC and SIDS groupings;[8]
3. FAOSTAT land area (sq. km) as provided in dataset AG.LND.TOTL.K2 for terrestrial land area;[9]
4. World Bank Income Group.[10]

This paper is accompanied by an online interactive model.[11] The online model allows each Party and indigenous peoples and local communities to explore the allocation formula. The interactive model is accompanied by an online code repository.[12] The repository contains all code and datasets used to construct the model as well as detailed sensitivity tests, tests exploring the balance points considered below and unit tests for all code. Construction and testing of the model has taken advantage of the availability of advanced AI software engineering tools to support design, testing and review of the model. Details of the use of AI tools are provided with the repository. A human (Dr. Paul Oldham) was responsible for all

aspects of decision-making in design, code development and testing of the model for discussion by the AHTEG.

III. Background

In Decision 16/2, the Conference of the Parties to the Convention in Biological Diversity adopted modalities for operationalizing the multilateral mechanism for the sharing of benefits from the use of digital sequence information on genetic resources, including the Cali Fund. A key element of decision 16/2 is the need for an allocation formula.

In the annex to decision 16/2, the Conference of the Parties provided guidance on the principles and purposes for allocations from the Cali Fund as follows:

> "17. Funding from the global fund should be allocated in a fair, equitable, transparent, accountable and gender-responsive manner.
>
> 18. Funding should support the realization of the objectives of the Convention in developing country Parties, in particular the least developed countries and small island developing States, and Parties with economies in transition, especially the conservation and sustainable use of biodiversity, including through the delivery of activities described in national biodiversity strategies and action plans; contribute to scientific research on biodiversity; benefit indigenous peoples and local communities, including women and youth within those communities; and support the building of capacity, in accordance with Article 16 of the Convention, to generate, access, use, analyse and store digital sequence information on genetic resources according to capacity needs. Funding will also be available for those purposes to indigenous peoples and local communities in developed countries, where appropriate…"[13]

In Enclosure II of the annex to decision 16/2 the Conference of the Parties also set out a set of indicative criteria that may inform the design: (a) Biodiversity richness and other biodiversity-related criteria for which data are readily available at the national level; (b) The geographical origin of the genetic resources from which digital sequence information was derived; (c) Capacity needs for the conservation and sustainable use of biodiversity. The requirements of paragraph 18 are linked to requirements for the direct disbursement of funding to countries in paragraph 20 taking into account the available amount in the global fund and the indicative list of criteria as referenced in paragraph 19. Paragraph 20 anticipates that funding will be allocated in a transparent manner through a country or community driven process. Paragraph 21 states that: "Where appropriate, and subject to national circumstances and national legislation, at least half of the funding of the global fund should support the self-identified needs of indigenous peoples and local communities, including women and youth within those communities, through government authorities or by direct payments through institutions identified by indigenous peoples and local communities."

[13] The remainder of paragraph 18 refers to other international forums that may decide to make use of the multilateral mechanism for the purpose of benefit-sharing from the use of digital sequence information and is beyond the scope of this paper.

During informal discussions leading to COP16 the possibility of inverting the UN Scale of Assessments as a basis for an allocation formula was raised but not further elaborated. This paper elaborates that option.

The design of the allocation formula and its accompanying model is informed by, and builds on, the principles established by the COP in paragraph 17 of the annex to decision 16/2. Additional principles and design constraints informing this paper include:

- Respect for the sovereign equality of all Parties.
- Recognition of the importance of indigenous peoples and local communities, and of thematic areas for action outlined in the Programme of Work on Article 8(j) and Other Provisions of the Convention as adopted by the Conference of the Parties, as well as other relevant decisions of the Conference of the Parties, in support of implementation of the Kunming-Montreal Global Biodiversity Framework.
- To establish a formula based on existing measures within the United Nations System as established by the General Assembly and used by the COP as part of its procedures.
- Recognition that adjustments are likely to be required to take account of the costs incurred in the implementation of National Biodiversity Strategies and Action Plans and, where available, National Biodiversity Finance Plans, notably for middle-income developing country Parties;
- The desirability of preventing disproportionate concentration or dilution of available resources and to preserve the integrity of the inverted scale. This may, where necessary, involve the use of floors and ceilings.
- The overall formula and adjustments to the formula should be simple, robust, transparent and easy to communicate to achieve wide acceptance.

The formula presented in this paper responds to indicative Criteria C on capacity needs and Criteria A on biodiversity richness and other biodiversity related criteria using the proxies of economic capacity, the status of Parties as Small Island Developing States (SIDS) and terrestrial land area. This approach to the indicative criteria meets the design requirements of simplicity, transparency, robustness and ease of communication.

IV. Inverting the UN Scale of Assessments

The United Nations Scale of Assessments sets out the budget contributions that member states are expected to make to the United Nations core budget. The Scale of Assessments was established shortly after the founding of the United Nations under the Committee on Contributions.[14] The General Assembly approves the Scale of Assessments on a triennial basis. The current scale of assessments covers the period 2025-2027 and is used throughout this paper as the reference point.[15]

The Scale of Assessments is informed by a detailed methodology and involves a formula including Gross National Income (GNI), base periods, currency conversion, adjustments for

[14] https://www.un.org/en/ga/contributions/
[15] https://www.un.org/en/ga/contributions/scale.shtml

low per capita income (GNI) and debt burden adjustments.[16] The methodology makes use of a combination of floors and ceilings. The maximum contribution or ceiling for any member state is 22%. A specific ceiling on the maximum contribution applies to Least Developed Countries (LDCs) and is currently set at 0.010%.[17] The minimum contribution or floor is 0.001%.

The Scale of Assessments can be said to offer a measure of member states capacity to pay as agreed by member states themselves. That is, it is a measure of the economic capacity of member states. The United Nations General Assembly requires that the Contributions Committee prepare the Scale of Assessments based on reliable, verifiable and comparable data (e.g. UNGA Resolution 79/249 dated 31st December 2024). The Scale of Assessments is widely used and forms the basis for CBD budget setting as established by COP.

Raw Inversion of the UN Scale of Assessments

One immediate question in considering the inversion of the UN Scale is how to invert the scale and the consequences of approaches to inversion of the UN Scale for an allocation formula. During initial exploration the UN Scale was inverted country by country in a raw form as briefly described below.

The raw inversion of the UN Scale of Assessments involves taking the agreed budget contribution values, normalising them from percentage values (shares of 100) to decimals (shares of 1) as illustrated for three countries below:

Country A: 0.005% → 0.00005

Country B: 2.90% → 0.029

Country C: 20.00% → 0.20

To invert these values the reciprocal is calculated by dividing the number by 1 to create weights.

Country A: 1 ÷ 0.00005 = 20,000

Country B: 1 ÷ 0.029 ≈ 34.48

Country C: 1 ÷ 0.20 = 5

Identifying the reciprocal has inverted the values so that Country A has a higher weight than Country C. To arrive at percentage shares the weights are summed and then each weight is divided by the total. For the three example countries the total weight is: 20,000 + 34.48 + 5 = 20,039.48. This gives indicative shares that sum to 100% as follows:

Country A: 20,000 ÷ 20,039.48 ≈ 99.80%

Country B: 34.48 ÷ 20,039.48 ≈ 0.17%

[16] For a brief overview see the UNSD Briefing on Methodology the Scale of Assessments (2025) at https://www.un.org/en/ga/contributions/Briefing%20on%20scale%20methodology%20June%202025.pdf .
[17] https://www.un.org/ohrlls/content/list-ldcs

Country C: 5 ÷ 20,039.48 ≈ 0.02%

This is a conceptually simple and attractive starting point. However, in practice the UN Scale of Assessments is highly skewed with 2 UN member states (China and the United States) contributing at 20% and other member states contributing at a variety of different levels. Figure 1 shows the distribution of percentage contributions by UN member states using 6 bands on a log10 scale, with each band covering values ten times greater than the previous band (see below).

Figure 1: Distribution of Contribution Levels by Assessment Shares

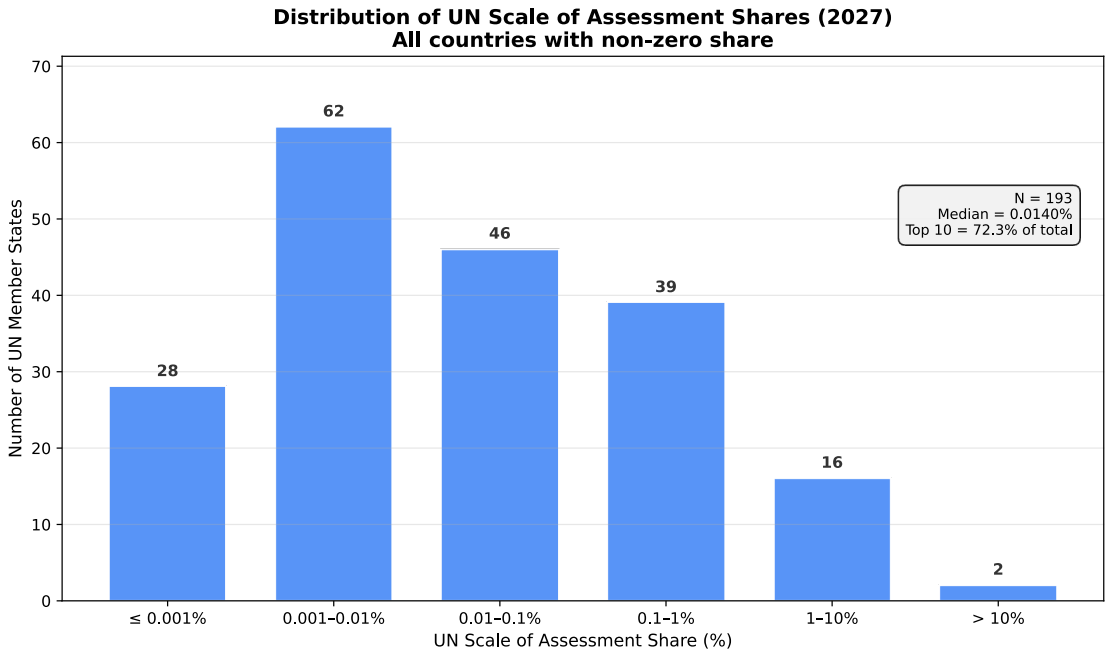

Figure 1 reveals that the UN Scale of Assessments is heavily skewed towards lower contributions with 18 member states making contributions of over 1 percent to the UN budget. This distributional skew has a major impact when the UN Scale is restricted to developing country Parties to the Convention (including SIDS). Figure 2 shows the effect of the raw inversion of the UN Scale using the logic described above for 142 developing country Parties including SIDS.

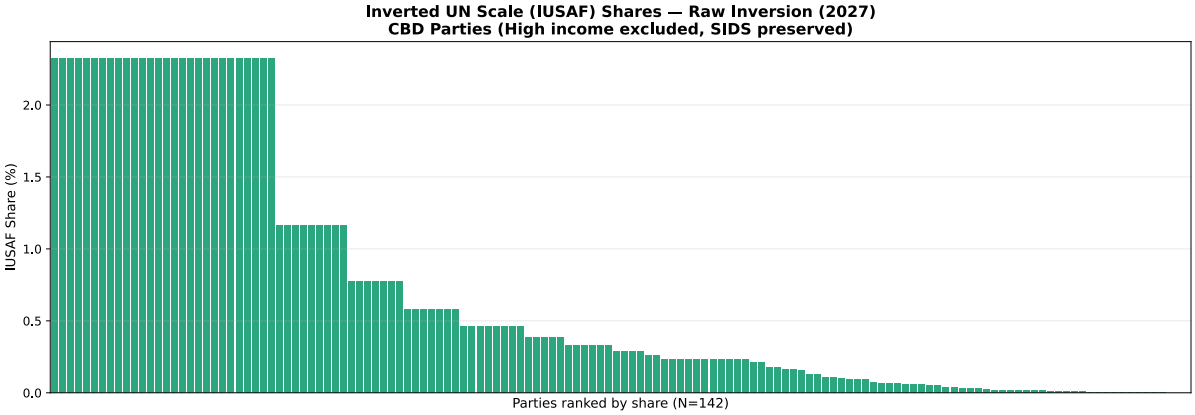
Figure 2: Raw Inversion of the UN Scale of Assessments



The inversion of the UN Scale has successfully allocated funds towards least developed and developing countries and SIDS in accordance with para. 18 of the annex to decision 16/2. However, the raw inversion has dramatic distributional effects across developing countries because approximately 90 countries at 0.01% or below would absorb around 96% of Cali Fund allocations. In this scenario large middle-income developing countries Parties would receive allocations approaching zero despite having significant biodiversity stewardship responsibilities. As such, it is reasonable to conclude that raw inversion would not meet the criteria of fairness and equity required in para. 17 of the annex to decision 16/2.

An additional consideration in rejecting raw inversion of the UN Scale is that three Parties to the Convention are non-member states of the United Nations: the State of Palestine, Niue and the Cook Islands. As such they would receive a zero allocation under raw inversion of the UN Scale. The modelling exercise is predicated on respect for the principle of sovereign equality between all Parties and this omission would not meet that requirement.

Band-Based Inversion of the UN Scale of Assessments

As suggested in Figure 1, the solution adopted is a band-based inversion approach. Rather than inverting each Party's individual assessed contribution, Parties are grouped into bands on the basis of their assessed contribution. The band boundaries follow a progression where each boundary is 10 times greater than the previous (a log10 progression) and coincides with the existing boundaries for LDCs and the UN minimum contribution rate or floor within the UN Scale. It is notable that under the UN Scale member states cluster around particular boundaries which lends itself to this intuitive approach.[18] The use of bands also allows sovereign equality and equity questions to be addressed for the three non-member state Parties noted above. They are included by default in band 1 which ranges from zero to 0.001%.

Each band is assigned a weight. Each Party within a band receives the same per-country allocation, computed as follows:

[18] The possibility of band boundary crossover in future UN Scale of Assessments is explored in the background research for this paper and can be accessed through the repository at: https://github.com/tierravivaai/cali-fund-allocation-model/blob/main/band-analysis/band-mobility-history/near_term_band_movement_note.md .

$$\textit{Per-country allocation} = \textit{band weight} \div \textit{sum of all Party weights} \times \textit{total fund size}$$

Since the weight is assigned at the individual Party level rather than the band level as a whole, the formula is simple and transparent: a Party's allocation is exactly proportional to its band weight. Parties in Band 1 each receive more than Parties in Band 2; Parties in Band 2 each receive more than Parties in Band 3; and so on down to Band 6, which contains the Parties with the largest assessed contributions.

A critical design requirement is that the allocation must be *monotone*: every Party in a lower-numbered band (smaller United Nations budget contributor) must receive a strictly higher per-Party allocation than every Party in a higher-numbered band (larger United Nations budget contributor). This requirement is not automatically satisfied: it depends on the relationship between band weights and the number of Parties in each band. The band weights have been chosen to ensure that strict monotonicity holds across all six bands, with every successive band yielding a lower per-Party allocation than the band below it.

The current band configuration is set out in Table 1. It should be noted that the weight values are choices determined by the requirement for strict monotonicity.

Table 1: Six-band IUSAF configuration

Band	UN assessed share range	Weight	Current membership	Per-Party allocation ($1 billion fund)	Ratio to Band 1
1	≤ 0.001 per cent	1.50	31 Parties at the floor (13 LDCs, 22 SIDS; categories overlap)	$8,525,149	1.00
2	0.001–0.01 per cent	1.30	59 Parties	$7,388,463	0.87
3	0.01–0.1 per cent	1.10	30 Parties	$6,251,776	0.73
4	0.1–1.0 per cent	0.95	18 Parties	$5,399,261	0.63
5	1.0–10.0 per cent	0.75	3 Parties (Brazil, India, Mexico)	$4,262,575	0.50
6	> 10.0 per cent	0.40	1 Party (China)	$2,273,373	0.27

Note: Per-Party allocations are illustrative, computed based on a fund size of $1 billion, with the Terrestrial Stewardship Allocation Component and the Small Island Developing States Ocean Stewardship Allocation Component both set to zero. In this table the per-Party allocation includes the government and indigenous peoples and local communities 50/50 split.

Band 1 contains the 31 Parties assessed at the United Nations budget minimum of 0.001 per cent. Band 1 comprises 22 SIDS and 13 LDC Parties (with some Parties falling into both categories) as well as other developing country Parties within that band. Under the six-band configuration, a Band 1 Party receives an allocation 3.75 times greater than a Band 6 Party (China). Band 2, with 59 Parties, is the largest band and spans assessed contributions from 0.001 per cent to 0.01 per cent; it includes Afghanistan, Bangladesh, the Democratic Republic of Congo, Ethiopia, Nepal, Uganda and the United Republic of Tanzania, among others. An

Annex provides reference tables for country allocations under pure IUSAF and the balance points discussed below for a $1 billion fund.[19]

Parties with large assessed contributions and Band 6

An earlier version of the model (v2) used a five-band configuration in which all Parties with assessed contributions above 1.0 per cent of the United Nations budget were placed in a single band. Under that configuration, the four Parties in that band - China (20.004 per cent), Brazil (1.411 per cent), India (1.106 per cent) and Mexico (1.137 per cent) - each received an identical per-Party allocation, notwithstanding that China's assessed contribution is approximately 14-18 times larger than other members of that band (14.2 x for Brazil and 18.1 x for India).

In order to address that inconsistency, a sixth band was introduced for Parties with assessed contributions above 10.0 per cent of the United Nations budget. Currently, that band contains only China. The threshold of 10.0 per cent reflects the fact that China's assessed contribution is of a substantially different order of magnitude from that of all other eligible Parties. The use of 10.0 maintains the intuitive log10 progression of the scale.

The Band 6 weight of 0.40 was informed by a first round of sensitivity testing. At that weight, China receives a per-Party allocation equivalent to 53 per cent of the per-Party allocation of the Parties in Band 5. This acknowledges the substantial difference in assessed contributions while preserving a non-trivial allocation consistent with the general philosophy of the banding approach. The Terrestrial Stewardship Allocation Component described below provides additional recognition of the Party's large land area and corresponding biodiversity stewardship responsibilities through a separate and transparent mechanism.

Any Band 6 weight in the range 0.30 to 0.55 would preserve full monotonicity across all six bands. The weight of 0.40 represents a midpoint of that range.[20] Parties may wish to consider whether a different value within that range better reflects the balance of considerations, including the relationship between the IUSAF base allocation and the Terrestrial Stewardship Allocation Component.

It may be observed that full monotonicity across the bands is a structural requirement of the model presented in this paper (see below). Outside of that requirement the weightings assigned to each band are a policy choice. If the band weights are steepened, Parties in Band 1 would receive more than Parties in higher numbered bands. If the band weights are flattened, Parties in higher numbered bands would receive proportionately more. As noted above, the weights assigned to bands are choices. However, consideration of adjustment to band weights should be seen in light of the values assigned to SOSAC and TSAC considered below as the main suggested policy levers under the model.

[19] A full set of Annex tables is provided with the repository for Cali Fund volumes at $50M, $200M, $500M and $1 billion. See: https://github.com/tierravivaai/cali-fund-allocation-model/tree/main/country-annexes

[20] The arithmetic midpoint is 0.425 rather than 0.40. However, 0.40 was chosen to keep weights as clean 0.05 increments.

The IUSAF Equity Base

An Annex provides individual country level reference tables for a fund volume at $1 billion.[21] The model also uses the standard UNSD M49 United Nations regions, sub-regions and intermediate regions to allow Parties to examine options from different standpoints and different scales of the Cali Fund.[22] Tables are also available for LDCs[23] and SIDS.[24] This paper and the model use the World Bank Income Group classification that is based on Gross National Income (GNI) using the World Bank Atlas Method.[25] The main use of the classification is to identify and exclude high income Parties (except SIDS). It has no role in the model beyond that function. It is retained for display purposes to aid in interpretation of the data by economic characteristics.

The Tables below summarise the baseline IUSAF allocations for each of the United Nations regions and for Least Developed Countries and Small Island Developing States. In all cases the tables refer to the 142 eligible developing, least developed (LDC) and SIDS Parties.

Table 2: IUSAF Allocation by UN Region

Fund size: USD 1,000 M | State/IPLC split: 50/50

UN Region	Countries	Total Allocation (USD M)	State Component (USD M)	IPLC Component (USD M)
Africa	54	394.15	197.07	197.07
Americas	29	194.37	97.19	97.19
Asia	37	239.84	119.92	119.92
Europe	8	54.56	27.28	27.28
Oceania	14	117.08	58.54	58.54
Total	**142**	**1,000.00**	**500.00**	**500.00**

Table 6: IUSAF Allocation Small Island Developing States (SIDS)

Fund size: USD 1,000 M | State/IPLC split: 50/50

Group	Countries	Total Allocation (USD M)	State Component (USD M)	IPLC Component (USD M)
Small Island Developing States (SIDS)	39	304.63	152.32	152.32
Other Countries	103	695.37	347.68	347.68
Total	**142**	**1,000.00**	**500.00**	**500.00**

As a starting point in considering the tables above, we will begin with the treatment of the indigenous peoples and local communities (IPLC) component. This approach will allow for detailed exploration of the country and regional dimensions while not losing sight of indigenous peoples and local communities. We then return to indigenous peoples and local communities at the end of the paper.

Indigenous Peoples and Local Communities (IPLC) Component

The model offers a straightforward route to determining the indigenous peoples and local communities share as required by decision 16/2. Funding is allocated by country as a geographic entity and divided into a state component and an indigenous peoples and local communities component. This approach has four main advantages:

a) it is grounded in the reality that indigenous peoples and local communities live in the jurisdictions of Parties where they play a vital role in conservation and sustainable use;

b) it is fully transparent to Parties and indigenous peoples and local communities;

c) indigenous peoples and local communities are automatically included and the indigenous peoples and local communities component scales automatically for different fund sizes;

d) it opens up space for deliberation on appropriate pathways to disbursement for indigenous peoples and local communities.

The approach to the allocation component does not address the question of appropriate pathways to disbursement of the indigenous peoples and local communities allocation. In practice appropriate pathways to disbursement may take a variety of direct and indirect routes ranging from the global to regional, sub-regional, national and sub-national levels (for discussion see CBD/SB8J/1/2 & CBD/SB8J/REC/1/1). The Programme of Work on Article 8(j) and Other Provisions of the Convention on Biological Diversity Related to Indigenous Peoples and Local Communities, adopted by the Conference of the Parties in its decision 16/4, establishes a framework within which the 50 per cent of Cali Fund resources allocated to indigenous peoples and local communities, including women and youth, could be disbursed. Under this approach, the allocation formula determines the country envelope and extends to the UN region and sub-regional level; the question of how that envelope is divided between government and indigenous peoples and local communities components, and the pathways through which indigenous peoples and local communities components are disbursed could be addressed through the framework provided by the programme of work on Article 8(j).[26]

A UN Regional Perspective

Under raw equality between the 142 eligible developing country Parties, under a $1 billion fund each Party would receive $7,042,253. Under IUSAF each Party's allocation is determined by the banded inversion of the UN Scale discussed above that deliberately and transparently favours Parties with lower contributions to the UN budget.

[26] A discussion paper was made available to the AHTEG on this topic entitled: The Cali Fund and Indigenous Peoples and Local Communities: Disbursement Pathways, Guiding Principles and Linkages to the Programme of Work on Article 8(j). Discussion Paper for the AHTEG on Allocation Methodology.

Viewed from a regional perspective Africa, as the largest region with 54 countries, leads the allocation with the 48 Parties in Sub-Saharan Africa as the main recipients (e.g., Burundi, Cabo Verde, and Central African Republic among others). This is followed by Asia with 10 Parties in Western Asia (e.g., the State of Palestine, Armenia and Georgia among others). The allocation in the Americas is confined to Latin America and the Caribbean. Country level tables are available in the Annex.[27]

A regional perspective may also be useful to Parties in considering funding arrangements under different scales of the Cali Fund. For example, are regional or sub-regional funding allocations appropriate or desirable at certain scales? What might the relationship be between the Cali Fund and existing or emerging regional funds in terms of efficiency in disbursement. In the case of indigenous peoples and local communities a number of funds, including direct access funds managed by indigenous peoples and local communities, already exist and may serve as appropriate pathways for disbursement as the Cali Fund becomes operational. The purpose of highlighting these possibilities is to note, rather than elaborate, the opportunities that approaching allocation and disbursement from a United Nations regional perspective may offer.

Highest, Lowest and Middle Ground Allocations

In assessing allocation models it is common to ask the question of who receives the highest and the lowest allocations among Parties as shown in Table 7 and Table 8. It is also important to be able to see the middle ground as provided in Table 9.

[27] A full set of Annex tables is provided for Cali Fund volumes at $50M, $200M, $500M and $1 billion. See: https://github.com/tierravivaai/cali-fund-allocation-model/tree/main/country-annexes

3	Bahamas	6.25	3.13	3.13	High income	Band 3: 0.01% - 0.1%
3	Botswana	6.25	3.13	3.13	Upper middle income	Band 3: 0.01% - 0.1%
3	Cameroon	6.25	3.13	3.13	Lower middle income	Band 3: 0.01% - 0.1%
3	Dominican Republic	6.25	3.13	3.13	Upper middle income	Band 3: 0.01% - 0.1%
3	Ecuador	6.25	3.13	3.13	Upper middle income	Band 3: 0.01% - 0.1%
3	El Salvador	6.25	3.13	3.13	Upper middle income	Band 3: 0.01% - 0.1%
3	Gabon	6.25	3.13	3.13	Upper middle income	Band 3: 0.01% - 0.1%

The logic of the Inverted UN Scale is clearly visible in Tables 7 to 9. The top allocations will go to those in Band 1, there is then a large middle ground occupied by Bands 2 - 3 where the majority of Parties will be found. At the lower end of the allocations are Parties in Band 4 - 6 with China receiving the smallest allocation in Band 6.

A useful feature of these tables is that it provides Parties with a fully grounded perspective on the amounts of funds that may be generated under different Cali Fund sizes in terms of the volumes at stake. At the $1 billion point under raw equality each Party would receive $7 million. Under IUSAF the maximum any single developing country Party would receive would be $8.5 million with the minimum ranging between from $4.2 to $2.2 million for Parties in Bands 5 and 6.

V. Stewardship Components

In considering the outcomes of the IUSAF allocation there is a question of whether Parties are satisfied that this meets the criteria of fairness and equity or whether additional adjustments are desirable. There are two cases that may require further consideration and are addressed in the stewardship components of the model. Both involve recognition of the structural conditions involved in biodiversity stewardship as represented in the costs of implementing National Biodiversity Strategies and Action Plans and, where available, National Biodiversity Finance Plans.

The first of these structural conditions involves Small Island Developing States. The structural challenges facing Small Island Developing States are formally recognised by the United Nations. Their remoteness and dispersed geographic nature relative to the size of their populations give rise to high transport and communication costs as well as significant vulnerability to climate change. In particular, SIDS face ocean biodiversity stewardship challenges in the implementation of NBSAPs and National Biodiversity Finance Plans in pursuit of implementation of the Kunming-Montreal Global Biodiversity Framework.

The second of the structural considerations involves Parties with a large terrestrial landmass who face higher biodiversity stewardship burdens arising from the requirement to govern, monitor, conserve and sustainably use biodiversity across large and ecologically complex jurisdictions. These countries are, by virtue of their geography and biogeographic characteristics, often among the world's most biodiverse. They are also commonly lower or upper middle-income countries in the higher bands of the IUSAF allocation (e.g. band 4-6). The question this raises is whether, and to what extent, these additional stewardship burdens should be recognised in the allocation formula.

Large territorial and biogeographic extent can create structural biodiversity stewardship burdens comparable in kind, though not necessarily degree, to the marine stewardship burdens faced by SIDS. This suggests a need to recognise the different biodiversity stewardship responsibilities faced by some Parties and for two types of adjustment or overlay to the IUSAF equity base.

As noted above, the Terrestrial Stewardship Allocation Component (TSAC) and the SIDS Ocean Stewardship Allocation Component (SOSAC) are adjustments or overlays on the IUSAF equity base. Percentage values can be assigned to each component, and each operates independently. The key characteristic of the stewardship components is that *every point of increase proportionally reallocates funds from IUSAF base allocation* to the TSAC and SOSAC component Parties. We will address each in turn starting with SOSAC.

SIDS Ocean Stewardship Component (SOSAC)

The objective of the ocean stewardship component is to recognise the stewardship costs that affect Small Island Developing States (SIDS) in implementing their NBSAPs. A number of options were considered in how to treat the 39 members of SIDS including the use of calculations of EEZ size. However, such an option could introduce unexpected complexity at the expense of the requirement for simplicity. That is, SIDS ocean areas vary widely in size making any calculation complex and such a calculation could potentially involve disagreements between sovereign states around EEZ's. In accordance with the principles of simplicity and fairness, each percentage increase in SOSAC is allocated equally between the 39 SIDS Parties.

The second question to be addressed is how to define possible percentage points for the SOSAC setting. Table 10 shows the distribution of SIDS Parties across the IUSAF bands, and a proposed 3% default uplift explained below.

Table 10: SIDS Distribution Across IUSAF Bands

39 eligible SIDS Parties | Fund size: USD 1,000 M | SOSAC = 3%

UN Band	UN Share Range	SIDS (n)	Avg IUSAF Allocation (USD M)	SOSAC at 3% (USD M per SIDS)	SOSAC as % of IUSAF
Band 1	≤ 0.001%	22	8.53	0.769	9.0%
Band 2	0.001% – 0.01%	11	7.39	0.769	10.4%
Band 3	0.01% – 0.1%	4	6.25	0.769	12.3%
Band 4	0.1% – 1.0%	2	5.40	0.769	14.2%
Total	**-**	**39**	**7.76***	**0.769**	**10.4%***

**Weighted average across all 39 SIDS. SOSAC is equal-share (USD 30M / 39 = USD 0.769M per SIDS).*

As a starting point we observe that the majority of SIDS Parties (22) are located in Band 1 which leads to the highest IUSAF allocations. The 17 SIDS Parties in band 2-4 have a lower IUSAF allocation and will therefore benefit proportionately more from the SOSAC uplift. The operating assumption is that the point at which all SIDS cross a double-digit threshold uplift marks the appropriate default position. The key consideration here is the 17 SIDS Parties in bands 2-4. At SOSAC 3% the 17 SIDS Parties receive an uplift of between 10-14% of their IUSAF allocation. At 3% the SOSAC uplift for Band 1 SIDS Parties is 9%. The logic behind this is demonstrated in Table 11.

Table 11: Why SOSAC = 3%: Integer Percentage Comparison

SOSAC as % of IUSAF baseline, by SIDS band | Fund size: USD 1,000 M | 39 eligible SIDS

SOSAC	SOSAC Pool (USD M)	Per SIDS (USD M)	Band 1 (22 SIDS)	Band 2 (11 SIDS)	Band 3 (4 SIDS)	Band 4 (2 SIDS)
1%	10.0	0.256	3.0%	3.5%	4.1%	4.7%
2%	20.0	0.513	6.0%	6.9%	8.2%	9.5%
3%	**30.0**	**0.769**	**9.0%**	**10.4%**	**12.3%**	**14.2%**
4%	40.0	1.026	12.0%	13.9%	16.4%	19.0%
5%	50.0	1.282	15.0%	17.4%	20.5%	23.7%

Bold green row = SOSAC = 3%, the minimum integer percentage where SOSAC reaches ~10%+ of IUSAF for Band 2–4 SIDS. At 1–2%, SOSAC remains below 10% of IUSAF for all bands. Band sub-heading shows n SIDS per band. SOSAC pool = SOSAC% × USD 1,000M. Per SIDS = pool / 39.

At 3% SOSAC on a $1 billion fund the SOSAC uplift is $769,000 per SIDS Party. It should be emphasised that the setting of 3% as a default value for SIDS is a reasoned choice based on the pursuit of fairness in the allocation between SIDS Parties. At the same time, within the context of the wider IUSAF equity base, sensitivity analysis of changes in the rank order of allocations to Parties using the Spearman rank-order correlation coefficient - which measures changes in rank - reveals a modest change in rank with a value of $\rho = 0.977$ (with 1 as the IUSAF base rank). This creates a change in the rank order for the 39 SIDS order and breaks ties with band 1 by pushing the 22 SIDS Parties in band 1 above the non-SIDS Parties in band 1. The pure-IUSAF baseline allocation for all band 1 Parties is $8.53M. Under the formula, introducing SOSAC at 3% rescales the IUSAF component by $(1- \gamma) = 0.97$ to $8.27M and adds the SOSAC uplift of $0.769M for SIDS Parties only, so the SIDS band 1 allocation becomes $9.04M (and non-SIDS band 1 falls to $8.27M). As this suggests, the amounts involved on a $1 billion fund are small but non-trivial in terms of the contribution they can make to addressing the increased costs of ocean stewardship for SIDS Parties in implementing their NBSAPs and, where available, National Biodiversity Finance Plans.

In considering the rationale for the proposed settings for SOSAC it is important to identify the point at which SOSAC would overturn the IUSAF equity base as the driver for the

allocation. Sensitivity analysis revealed that this point is found at 17%. Viewed from this perspective the proposed 3% allocation could be considered as a modest uplift to recognise ocean stewardship.

For the remainder of this paper, unless otherwise specified, SOSAC will be set at 3%. We now turn to the Terrestrial Stewardship Allocation Component.

Terrestrial Stewardship Allocation Component (TSAC)

It may be useful to recall that the development of the Option A IUSAF model follows the logic of para. 18 of the annex to decision 16/2. The first element that was addressed is the basis for the allocation to developing countries and least-developed countries (LDCs) that was resolved with IUSAF. The second element is to address the allocation for Small Island Developing States through the modest uplift represented by SOSAC. The third element seeks to address the challenges confronting middle income developing countries who receive a lower IUSAF allocation to support the implementation of their NBSAPs and, where available, National Biodiversity Finance Plans.

The Terrestrial Stewardship Allocation Component uses the widely accepted FAOSTAT land area indicator that measures the total surface area of a country in square kilometres (FAOSTAT land area AG.LND.TOTL.K2) and is accessible through World Bank Open Data portal.[28] The measurement of land area is used in preference to more complex and contested measures such as species richness and excludes marine EEZ measurements to meet the requirements for simplicity and transparency in the allocation formula. In summary, the use of land area is preferred because it is:

- **Objective and verifiable**: Available from a standard international dataset and is not subject to the definitional disputes that affect marine-area measurements.
- **Correlated with stewardship scope**: Larger territories generally entail greater biodiversity stewardship responsibilities and higher NBSAP implementation costs.
- **Simple and transparent**: The proportional allocation is straightforward to compute and explain.

Table 12 shows the top 20 for eligible Parties ranked by the terrestrial land area along with their IUSAF band and World Bank income group.

[28] https://data.worldbank.org/indicator/AG.LND.TOTL.K2

Table 12: Terrestrial Land Area and IUSAF Allocation: Top 20 Countries

142 eligible Parties | Ranked by FAOSTAT land area (km²) | IUSAF allocation from pure IUSAF baseline

Rank	Party	Land Area (km²)	UN Band	IUSAF Allocation (USD M)	WB Income Group	LDC
1	China	9,388,210	Band 6 (>10.0%)	2.27	Upper middle income	-
2	Brazil	8,358,140	Band 5 (1.0–10.0%)	4.26	Upper middle income	-
3	India	2,973,190	Band 5 (1.0–10.0%)	4.26	Lower middle income	-
4	Argentina	2,736,690	Band 4 (0.1–1.0%)	5.40	Upper middle income	-
5	Kazakhstan	2,699,700	Band 4 (0.1–1.0%)	5.40	Upper middle income	-
6	Algeria	2,381,740	Band 3 (0.01–0.1%)	6.25	Upper middle income	-
7	Democratic Republic of the Congo	2,267,050	Band 2 (0.001–0.01%)	7.39	Low income	Yes
8	Mexico	1,943,950	Band 5 (1.0–10.0%)	4.26	Upper middle income	-
9	Indonesia	1,892,555	Band 4 (0.1–1.0%)	5.40	Upper middle income	-
10	Sudan	1,868,000	Band 2 (0.001–0.01%)	7.39	Low income	Yes
11	Libya	1,759,540	Band 3 (0.01–0.1%)	6.25	Upper middle income	-
12	Iran (Islamic Republic of)	1,622,500	Band 4 (0.1–1.0%)	5.40	Upper middle income	-
13	Mongolia	1,558,500	Band 2 (0.001–0.01%)	7.39	Upper middle income	-
14	Peru	1,280,000	Band 4 (0.1–1.0%)	5.40	Upper middle income	-
15	Niger	1,266,700	Band 2 (0.001–0.01%)	7.39	Low income	Yes
16	Chad	1,259,200	Band 2 (0.001–0.01%)	7.39	Low income	Yes
17	Angola	1,246,700	Band 2 (0.001–0.01%)	7.39	Lower middle income	Yes
18	Mali	1,220,190	Band 2 (0.001–0.01%)	7.39	Low income	Yes
19	South Africa	1,213,090	Band 4 (0.1–1.0%)	5.40	Upper middle income	-
20	Ethiopia	1,128,499	Band 2 (0.001–0.01%)	7.39	Low income	Yes

Band colouring: *Red = Band 6 | Orange = Band 5 | Blue = Band 4 | Green = Band 3 | Purple = Band 2*
Source: FAOSTAT land area (AG.LND.TOTL.K2). IUSAF allocation from pure IUSAF baseline (TSAC = 0%, SOSAC = 0%).

Table 12 makes clear that eligible Parties with the largest land areas fall into the lowest IUSAF bands (Band 6, 5, 4) because their high UN Scale shares produce the lowest inverted weights. This inverse relationship between economic capacity (UN Scale) and terrestrial biodiversity stewardship responsibility (land area) is the structural rationale for TSAC.

The key question in considering the TSAC component is the range of values that can be applied to recognise terrestrial biodiversity stewardship without breaching the structural constraint of not overturning the IUSAF band order. In the logic applied to model development the SOSAC component is held at 3%. For this we turn to sensitivity analysis.

Sensitivity Analysis: Band-Order Preservation as the Structural Constraint

In depth sensitivity analysis was performed using two principal measures:

a) The Spearman rank co-efficient. This provides fine grained detection of changes in the IUSAF equity base rank order between Parties with values between -1 to +1 to measure how well the monotonic rank is maintained under different TSAC values;
b) The Gini-coefficient. This measures levels of equality with a value of 0 as perfect equality and 1 as perfect inequality. It is typically used to measure wealth inequality and in this case is used to measure inequality between Parties in the allocation. The value closest to 0 establishes the Gini-minimum.

Sensitivity analysis establishes that, in contrast with SOSAC, TSAC rapidly becomes a dominant overlay on the IUSAF equity base and requires careful consideration of balance points. Progressively increasing the TSAC value produces a structural breakpoint where the IUSAF band ordering is subverted at the band-mean level so that the Band 6 mean exceeds the Band 5 mean. At the Party level, China (Band 6) overtakes the per-Party allocations of India and Mexico, while Brazil's per-Party allocation remains above China's throughout the relevant range. Under pure IUSAF, the allocation ordering is strictly monotonic: Band 1 > Band 2 > Band 3 > Band 4 > Band 5 > Band 6.

The model adopts band-order preservation as its structural constraint: the Gini-minimum TSAC value is the lowest point where the Gini coefficient is minimised while maintaining the descending band order (Band 5 mean > Band 6 mean). A Spearman safety floor of $\rho = 0.80$ is also maintained but does not bind at any policy-relevant TSAC setting (the Spearman correlation is $\rho = 0.945$ at the Gini-minimum, well above the floor).

Three Balance Points

Three potential balance points are presented for consideration, each defined by its relationship to the band-order preservation constraint:

- **Strict (TSAC = 1.5%, SOSAC = 3%):** The IUSAF equity base is dominant for all eligible Parties without exception. Stewardship supplements never exceed the equity base for any Party. Band order is preserved with a comfortable gap of $0.95M (Band 5 mean $4.92M vs Band 6 mean $3.97M), a relative margin of 19.3% of the Band 5 mean. Spearman $\rho = 0.951$.
- **Gini-minimum (TSAC = 2.5%, SOSAC = 3%):** The point at which the Gini coefficient is lowest while preserving IUSAF band order. This is the Gini-minimum point subject to the constraint of band-order preservation. At this setting the TSAC component exceeds IUSAF for the Party with the largest terrestrial land area (China, TSAC/IUSAF ratio 1.40). All other Parties remain below the IUSAF component (Brazil 0.66, India 0.24, Mexico 0.16). Band order is preserved with a slim absolute gap of $0.29M (Band 5 mean $5.44M vs Band 6 mean $5.15M), a relative margin of 5.4% of the Band 5 mean. Spearman $\rho = 0.945$.
- **Band-order boundary (TSAC ≈ 3.0%, SOSAC = 3%):** The structural ceiling at which the descending band order is just overturned: Band 6 mean allocation ($5.74M) marginally exceeds Band 5 ($5.70M). Beyond this point, China (Band 6) receives a higher per-Party allocation than India and Mexico (Band 5), breaking the IUSAF

monotonic requirement at the level of the band-mean. Brazil's per-Party allocation remains above China's throughout the policy-relevant range. Spearman ρ = 0.929.

Stewardship Pool Volumes

In considering the discussion of balance points it is useful to gain an overall perspective by calculating the volume of funds that are being allocated for IUSAF and TSAC and SOSAC. Under a US$1 billion fund 94.0–95.5% ($940–955m) will be stably allocated under the IUSAF. The amount under consideration for allocation under the three balance point scenarios is 4.5–6.0% of the Cali Fund or $45–60 million on a $1 billion fund. Under these scenarios for 142 developing country Parties the vast majority would see reallocations of less than $0.5 million. As such, if IUSAF is accepted as the stable baseline, the question for consideration by Parties would be how to allocate the $45–60 million stewardship pool. Note that the size of the stewardship pool will scale in accordance with the overall size of the Cali Fund.

Table 13 shows how the stewardship pool and its IUSAF, TSAC, and SOSAC components break down under each balance point at different projected fund sizes.

Table 13: Component allocation by balance point and fund size (USD millions, IUSAF, TSAC, SOSAC)

Balance Point	IUSAF %	TSAC %	SOSAC %	$50m IUSAF TSAC SOSAC (USD M)	$200m IUSAF TSAC SOSAC (USD M)	$500m IUSAF TSAC SOSAC (USD M)	$1bn IUSAF TSAC SOSAC (USD M)	$5bn IUSAF TSAC SOSAC (USD M)	$10bn IUSAF TSAC SOSAC (USD M)
Strict (1.5%, 3%)	95.5%	1.5%	3%	47.8 0.8 1.5	191.0 3.0 6.0	477.5 7.5 15.0	955.0 15.0 30.0	4775.0 75.0 150.0	9550.0 150.0 300.0
Gini-minimum (2.5%, 3%)	94.5%	2.5%	3%	47.2 1.2 1.5	189.0 5.0 6.0	472.5 12.5 15.0	945.0 25.0 30.0	4725.0 125.0 150.0	9450.0 250.0 300.0
Band-order boundary (3.0%, 3%)	94.0%	3.0%	3%	47.0 1.5 1.5	188.0 6.0 6.0	470.0 15.0 15.0	940.0 30.0 30.0	4700.0 150.0 150.0	9400.0 300.0 300.0

Table 14 shows the total stewardship pool (TSAC + SOSAC) under each balance point, making clear the amount 'in play' at different fund sizes.

Table 14: Total stewardship pool (TSAC + SOSAC) by balance point and fund size

Balance Point	Pool %	Pool at $50m	Pool at $200m	Pool at $500m	Pool at $1bn	Pool at $5bn	Pool at $10bn
Strict (1.5%, 3%)	4.5%	$2.2m	$9.0m	$22.5m	$45.0m	$225.0m	$450.0m
Gini-minimum (2.5%, 3%)	5.5%	$2.8m	$11.0m	$27.5m	$55.0m	$275.0m	$550.0m
Band-order boundary (3.0%, 3%)	6.0%	$3.0m	$12.0m	$30.0m	$60.0m	$300.0m	$600.0m

These tables confirm that regardless of fund size, the IUSAF equity base accounts for 94.0–95.5% of the Cali Fund and the stewardship pool is 4.5–6.0%. At the most likely fund sizes under discussion ($200m–$1bn), the stewardship pool ranges from $9m to $55m at the band order preserving Gini-minimum, and from $9m to $60m at the band-order boundary.

Having considered the likely size of the stewardship pool we now turn to the results of sensitivity analysis to consider the implications of the values that could be attributed to TSAC.

Band-Order Preservation Across TSAC Levels

Table 15 shows how the mean allocation for Band 6 (China) and Band 5 (Brazil, India, Mexico) changes as TSAC increases, and whether the descending (monotonic) IUSAF band ordering for allocations is preserved.

Table 15: Band-order preservation across TSAC levels (SOSAC = 3%)

TSAC Level	Band 6 mean (China)	Band 5 mean (Brazil, India, Mexico)	Band 5 vs Band 6 margin	IUSAF Band Order Preserved?
Pure IUSAF (TSAC = 0%)	USD 2.21M	USD 4.13M	+46.7%	YES
Strict	USD 3.97M	USD 4.92M	+19.3%	YES (margin 19.3%)
Gini-minimum	**USD 5.15M**	**USD 5.44M**	**+5.4%**	**YES (margin 5.4%)**
Band-order boundary	**USD 5.74M**	**USD 5.70M**	**-0.6%**	**NO - Band 6 overtakes Band 5**
Bounded	USD 6.33M	USD 5.97M	-6.0%	NO - Band 6 overtakes Band 5
TSAC component overturn	USD 13.04M	USD 8.95M	-45.7%	NO - Band 6 overtakes Band 5

The key observation in Table 15 is that at TSAC = 2.5% (the Gini-minimum) the IUSAF band order is preserved with a slim gap of $0.29M (a relative margin of 5.4% of the Band 5 mean), but at TSAC = 3.0% Band 6 is receiving a higher allocation than Band 5, breaking the descending monotonic requirement. This overturn occurs at a TSAC value 17× lower than the simple model overturn threshold (the point where TSAC + SOSAC = 50%), underscoring the sensitivity of the band ordering to the TSAC stewardship overlay.

Break-Point Summary

Table 16 summarises the key metrics at each break-point, including the Spearman rank correlation against the pure IUSAF baseline, the IUSAF share of the fund, and the structural status of the band ordering.

Table 16: TSAC Break Point Summary (SOSAC = 3%, Spearman vs pure IUSAF)

TSAC	SOSAC	IUSAF %	Spearman ρ	Band Order	What Happens
0%	3%	97.0%	0.977	Preserved	SOSAC only - modest rank shift among SIDS
1.5%	3%	95.5%	0.951	Preserved (19.3%)	Strict - IUSAF dominant for all Parties
2.5%	**3%**	**94.5%**	**0.945**	**Preserved (5.4%)**	**Gini-minimum - lowest Gini preserving band order**
3.0%	**3%**	**94.0%**	**0.929**	**Overturned**	**Band-order boundary - Band 6 > Band 5**
3.5%	3%	93.5%	0.917	Overturned	Bounded - band order already overturned

It may be noted that the Spearman safety floor of ρ = 0.80 does not bind at any policy-relevant TSAC setting. The lowest Spearman value in the negotiation range (TSAC 1.5–3.0%) is ρ = 0.929, well above the floor. The Spearman correlation declines as TSAC increases through the transition zone but remains high throughout the policy-relevant range. Band-order preservation, not Spearman, is the binding structural constraint.

Ranking Trajectory

Table 17 shows the full ranking trajectory as TSAC increases from 0% to 10% at 0.5 percentage point intervals, with the Gini coefficient, Spearman correlation, and band-order status at each step.

Table 17: Full TSAC ranking trajectory (SOSAC = 3%)

TSAC %	IUSAF %	Spearman ρ	Gini	Band 6 mean ($M)	Band 5 mean ($M)	Band Order
0.0	97.0	0.977	0.1011	2.21	4.13	Preserved
0.5	96.5	0.952	0.0984	2.79	4.40	Preserved
1.0	96.0	0.952	0.0958	3.38	4.66	Preserved
1.5	95.5	0.951	0.0933	3.97	4.92	Preserved
2.0	95.0	0.948	0.0909	4.56	5.18	Preserved
2.5	**94.5**	**0.945**	**0.0886**	**5.15**	**5.44**	**Preserved**
3.0	**94.0**	**0.929**	**0.0866**	**5.74**	**5.70**	**Overturned**
3.5	93.5	0.917	0.0851	6.33	5.97	Overturned
4.0	93.0	0.898	0.0839	6.92	6.23	Overturned
4.5	92.5	0.871	0.0832	7.50	6.49	Overturned
5.0	92.0	0.852	0.0829	8.09	6.75	Overturned
6.0	91.0	0.808	0.0832	9.27	7.27	Overturned
7.0	90.0	0.786	0.0841	10.45	7.80	Overturned
8.0	89.0	0.743	0.0856	11.63	8.32	Overturned
9.0	88.0	0.713	0.0877	12.80	8.84	Overturned
9.2	87.8	0.696	0.0881	13.04	8.95	Overturned
10.0	87.0	0.666	0.0902	13.98	9.37	Overturned

The ranking trajectory shows that the Gini coefficient reaches its minimum at TSAC = 2.5% (Gini = 0.0886) while band order is still preserved. Beyond the band-order overturn at TSAC = 3.0%, the Gini continues to decline briefly before rising again as TSAC dominates. The policy-relevant range lies between the strict point (TSAC = 1.5%) and the Gini-minimum (TSAC = 2.5%), with the band-order boundary at TSAC = 3.0% as the structural ceiling.

Band Transfer Analysis: Who Gains and Who Loses

A key consideration for Parties is likely to be how TSAC reallocates funds between bands. Table 18 shows the composition of each IUSAF band under the pure IUSAF baseline. Band 2 is the largest group with 59 eligible Parties, including 31 LDCs and 11 SIDS. Band 6 contains a single upper-middle-income Party (China).

Table 18: IUSAF band composition (142 eligible Parties, high-income excluded)

IUSAF Band	Parties	LDCs	SIDS	Income distribution	IUSAF total (USD M)	Per-Party (USD M)
Band 1 (≤0.001%)	31	13	22	7 Low, 10 Lower-mid, 9 Upper-mid, 5 High	264.28	8.53
Band 2 (0.001–0.01%)	59	31	11	19 Low, 23 Lower-mid, 14 Upper-mid, 3 High	435.92	7.39
Band 3 (0.01–0.1%)	30	0	4	12 Lower-mid, 15 Upper-mid, 3 High	187.55	6.25
Band 4 (0.1–1.0%)	18	0	2	5 Lower-mid, 12 Upper-mid, 1 High	97.19	5.40
Band 5 (1.0–10.0%)	3	0	0	1 Lower-mid, 2 Upper-mid	12.79	4.26
Band 6 (>10.0%)	1	0	0	1 Upper-mid	2.27	2.27

Table 19 shows how total band allocations change relative to the pure IUSAF baseline as TSAC increases. Positive values indicate the band gains funds; negative values indicate the band loses funds.

Table 19: Change in total band allocation vs pure IUSAF (USD M, SOSAC = 3%)

Band	Parties	Change at 1.5% (USD M)	Change at 2.5% (USD M)	Change at 3.0% (USD M)	Change at 3.5% (USD M)	Change at 5.0% (USD M)
Band 1	31	+5.25	+2.75	+1.50	+0.26	-3.49
Band 2	**59**	**-6.52**	**-7.79**	**-8.42**	**-9.06**	**-10.96**
Band 3	30	-3.01	-3.32	-3.48	-3.63	-4.10
Band 4	18	+0.62	+1.94	+2.61	+3.27	+5.26
Band 5	3	+1.97	+3.54	+4.32	+5.11	+7.46
Band 6	1	+1.70	+2.88	+3.46	+4.05	+5.82

The transfer analysis reveals a striking pattern: Band 2, containing 59 eligible Parties (including 31 LDCs and 11 SIDS), consistently bears the largest absolute loss at every TSAC level, while Band 6 (a single upper-middle-income Party, China) would receive the largest absolute gain. At the Gini-minimum (TSAC = 2.5%), Band 2 loses $7.79M while Band 6 gains $2.88M - a 126.5% increase for Band 6 funded by a 1.8% reduction for Band 2. At TSAC = 3.5% (the bounded point), Band 2 loses $9.06M while Band 6 gains $4.05M - a 178.3% increase.

This hypothetical scenario raises an important consideration: TSAC would reallocate funds from the largest group of developing countries (Band 2, predominantly low and lower-middle income) towards the Party with the largest land area (Band 6, an upper-middle-income country). Beyond the band-order boundary at TSAC = 3.0%, this transfer scenario also subverts the IUSAF ranking, giving China (Band 6) a higher per-Party allocation than India and Mexico (Band 5) with Brazil's per-Party allocation remaining above China's throughout the policy-relevant range. The band order preserving Gini-minimum (TSAC = 2.5%) represents the point at which the equality gains from this transfer are maximised while the band ordering that protects Band 5 is still preserved.

Reference Points Beyond the Policy Range

For completeness, three further reference points lie beyond the band-order boundary:

TSAC Component Overturn for China: (TSAC ≈ 1.8%): At this point the TSAC component overtakes the IUSAF component for China, meaning that China's allocation begins to be driven more by its land area than by its inverted UN Scale share. This threshold sits between the Strict point (TSAC = 1.5%) and the Gini-minimum with band preservation (TSAC = 2.5%). Any setting at or above the Gini-minimum with band preservation therefore places China's allocation in a TSAC-dominant regime even though IUSAF band hierarchy at the band-mean level is still preserved up to the band-order boundary at TSAC = 3.0%.

Bounded balance point: (TSAC = 3.5%): Defined in the model as the highest TSAC weight at which the TSAC/IUSAF ratio remains at or below 1.0 for Brazil (the binding Band 5 Party). At this setting Brazil's ratio is 0.94, India's 0.33, and Mexico's 0.22; China's ratio is 1.98. The point treats China separately on the rationale that the Band 6 weight already moderates China's IUSAF base and requires IUSAF dominance only for the Band 5 Parties (Brazil, India, Mexico). Band order at the band-mean level is not preserved at this setting (Band 6 mean $6.33M vs Band 5 mean $5.97M), Spearman $\rho = 0.917$. Parties accepting the structural rationale for the introduction of Band 6 (set out earlier) may consider this point as the balance point that most strongly preserves IUSAF dominance for the Band 5 Parties.

Potential Scenario: Consideration of Band-Order Relaxation. A potential consideration for Parties is whether the balance points above should preserve strictly decreasing (monotonic) order in the amounts allocated by the IUSAF band or whether relaxation is permitted in order to adequately recognise the stewardship responsibilities of some of the larger middle-income Parties. Under the structural constraint of the IUSAF band order, the Gini-minimum balance point (TSAC = 2.5%) preserves band order with a slim gap of $0.29M (relative margin of 5.4% of the Band 5 mean). If Parties wish to go beyond this towards greater terrestrial stewardship recognition, they may accept band-order relaxation, in which case settings up to TSAC = 3.5% (the "bounded" point noted above) remains within the range where IUSAF is still the dominant component for most Parties. However, such settings would mean that Parties in a higher band (Band 6) could receive allocations higher than Parties in a lower band (Band 5), breaching the strictly decreasing monotonic order of allocations.

Potential Scenario: Unconstrained Gini-minimum. Relaxation of band ordering requirements raises the additional question of what the consequences might be of using a Gini-minimum value that is unconstrained by the band order preservation requirement.[29] In the majority of scenarios IUSAF remains as the dominant overall driver for aggregate allocations. However, as the TSAC value increases the stewardship pool begins to concentrate funding in Parties with the largest land areas at the expense of severe structural violation and large rank-order disruption. For example, an unconstrained Gini-minimum at TSAC 5.35% and SOSAC fixed at 3% will result in a very high concentration of the TSAC pool uplift in the top 5 largest Parties by land-area (33.4%) rising to 46.7% for the top 10 Parties by land area. Under this scenario, IUSAF continues to provide approximately 92% of the total fund allocation, but the per-Party shares vary significantly: 87–94% IUSAF for the 138 Parties in Bands 1- 4, and a TSAC-dominated structure for the four developing country Parties with the largest landmass - India and Mexico at roughly 30% TSAC, Brazil at 59.4%, and China at 75.5%. At this point the Gini-coefficient improves modestly (from 0.0886 to 0.0828 or 0.006) but at the expense of severe changes to the ranking with Spearman ρ dropping from 0.945 to 0.839 and accelerating concentration of the TSAC component in Parties with the largest land areas. For this reason, a Gini-minimum that preserves band order has been preferred in this paper. It is a matter for Parties to consider the merits of alternative approaches relative to the principles set out in paragraph 17 of the annex to decision 16/2.

[29] The supporting documentation, code and data for this scenario can be found at https://github.com/tierravivaai/cali-fund-allocation-model/tree/main/band-analysis/gini-unconstrained

VI. Indigenous Peoples and Local Communities in Developed Countries

The IUSAF formula and associated model seek to solve the requirement that indigenous peoples and local communities are allocated at least 50% of the Cali Fund. This is achieved through an approach based on geographic country allocation per Party that is then split equally between a government and an indigenous peoples and local communities component. This has the considerable advantage of being easy to calculate and of scaling naturally for different sizes of the Cali Fund. When viewed from the level of United Nations regions, sub-regions and intermediate regions it also opens up the opportunity to discuss a variety of appropriate disbursement pathways on the regional, sub-regional, national and sub-national level.

In accordance with para. 18 of the annex to decision 16/2 the IUSAF formula excludes high income countries by definition. However, para. 18 of the annex to decision 16/2 also establishes that "Funding will also be available for those purposes to indigenous peoples and local communities in developed countries, where appropriate."[30] This raises the question of how funding might also be allocated for indigenous peoples and local communities in developed countries through the IUSAF model while maintaining the structural requirements discussed above. There are two potential answers to this question for consideration.

a) Given a total fund size (e.g., of $1 billion) calculate the percentage share that would be allocated to developed country Parties if all Parties were considered. Developed country Parties who recognise indigenous peoples and local communities would then be identified and their nominal allocation would be divided by 2. This would derive the allocation for indigenous peoples and local communities on a per Party basis as a percentage of the overall fund volume at different scales. That allocation could then be disbursed in accordance with the appropriate disbursement pathways identified with the participation of indigenous peoples and local communities. This has the benefit of being easy to calculate.
b) A refined version of this approach would, as a purely technical or paper exercise, be to identify the bands where the respective developed country Parties would appear in the IUSAF scale and then calculate the indigenous peoples and local communities share accordingly. That share would then be allocated within the Cali Fund as a percentage share of the volume of the fund at a given time. This approach has the advantage of strictly following the logic of the IUSAF formula without materially intervening in the structure of the model.

In order to advance testing of this approach, the two options outlined above were run using a selection of nine developed countries. Table 20 sets out the values obtained using raw equality between all Parties across the range of potential fund sizes for a selection of developed countries. Table 21 sets out the same information using the banded IUSAF approach.

[30] In this paper the term indigenous peoples and local communities is understood in light of Article 8(j) of the Convention with respect to "…indigenous and local communities embodying traditional lifestyles."

Table 20: Developed Country IPLC Component Only - Option 1: Raw Equality

9 developed countries | IPLC share: 50% | TSAC=0, SOSAC=0 | Cali Fund (%) = 9-country IPLC / Fund Size

Country	$50m IPLC (USD M)	$200m IPLC (USD M)	$500m IPLC (USD M)	$1bn IPLC (USD M)
Australia	0.13	0.51	1.28	2.55
Canada	0.13	0.51	1.28	2.55
Denmark	0.13	0.51	1.28	2.55
Finland	0.13	0.51	1.28	2.55
Japan	0.13	0.51	1.28	2.55
New Zealand	0.13	0.51	1.28	2.55
Norway	0.13	0.51	1.28	2.55
Russian Federation	0.13	0.51	1.28	2.55
Sweden	0.13	0.51	1.28	2.55
Total	**1.15**	**4.59**	**11.48**	**22.96**
Cali Fund (%)	2.30	2.30	2.30	2.30

Table 21: IPLC Component Only - Option 2: Banded IUSAF

9 developed countries added to bands | IPLC share: 50% | TSAC=0, SOSAC=0 | Cali Fund (%) = 9-country IPLC / Fund Size

Country	Band	$50m IPLC (USD M)	$200m IPLC (USD M)	$500m IPLC (USD M)	$1bn IPLC (USD M)
Australia	Band 5: 1.0% - 10.0%	0.10	0.41	1.02	2.04
Canada	Band 5: 1.0% - 10.0%	0.10	0.41	1.02	2.04
Denmark	Band 4: 0.1% - 1.0%	0.13	0.52	1.29	2.59
Finland	Band 4: 0.1% - 1.0%	0.13	0.52	1.29	2.59
Japan	Band 5: 1.0% - 10.0%	0.10	0.41	1.02	2.04
New Zealand	Band 4: 0.1% - 1.0%	0.13	0.52	1.29	2.59
Norway	Band 4: 0.1% - 1.0%	0.13	0.52	1.29	2.59
Russian Federation	Band 5: 1.0% - 10.0%	0.10	0.41	1.02	2.04
Sweden	Band 4: 0.1% - 1.0%	0.13	0.52	1.29	2.59
Total		**1.05**	**4.22**	**10.55**	**21.09**
Cali Fund (%)		2.11	2.11	2.11	2.11

The experiments presented in Tables 20 and 21 reveal that the developed country IPLC component would constitute between 2.11 and 2.30 per cent of the Cali Fund under any given volume. The relative closeness between the two values (raw equality vs. pure IUSAF) arises because some developed country Parties fall into band 4 of the Inverted UN Scale while others fall into band 5 with the effect of reducing the difference between the IUSAF and raw equality values.

One question arising from this approach is when this component would be calculated. Two approaches suggest themselves:

a) Prior to the allocation to the 142 developing country Parties on a fund of any given volume. That is the allocation would be deducted from the Cali Fund at volume *n* (e.g. $1 billion - 21-22M).

b) After allocation to the 142 developing country Parties. That is the allocation would be deducted after the wider allocation had been made.

A practical approach to addressing this question may be to simply reserve 2.11 - 2.30 per cent of the allocation for the developed country IPLC component. The final calculation would be based on the number of developed country Parties with an indigenous peoples and local communities component.

VII. Outstanding Issues:

This paper has presented a conceptually simple model for an allocation formula that addresses the requirements of the Annex to decision 16/2 in an ordered way. We now turn to outstanding issues.

- Paragraph 18 of the annex to decision 16/2 references economies in transition. Within the context of this paper economies in transition are understood as an analytical category rather than a focus of United Nations level policy action. Parties with economies in transition could be revisited and clearly marked in future outputs.
- As noted above, the monotonic steps in the IUSAF banding are a choice. It may be worth exploring the effects of steepening and flattening the slope of the banding criteria to gain a clearer view of the impacts on allocations across bands of different choices for these values within the constraint of the preservation of monotonicity.
- The main finding of the detailed sensitivity analysis of the current version of the model is that TSAC as it is presently constructed rapidly becomes a dominant overlay. The reason for this is essentially the same as the raw inversion of the UN scale discussed above. That is, the land size data is heavily skewed towards the largest countries. This could be addressed through a number of means including dividing the land mass data into bands in a similar way to the UN Scale. This could lower the rapid dominance of the TSAC overlay produced by Parties with a large land mass while potentially maintaining conceptual simplicity. However, it is currently unclear whether such an approach would maintain the clarity of choices presented by the analytical balance points from the present approach.

VIII. Future Development

The development of the model can be constructed to accommodate future changes such as the incorporation of proposals related to use of biodiversity information under Criteria A, Criteria C and new Criteria D for traditional knowledge. This may include the calculation of formula elements for the TSAC and potentially the SOSAC components. This could be envisioned as a transition towards what might be called a *Biodiversity Stewardship Responsibility Index* or *Biodiversity Stewardship Index*. Such a development would require careful testing with all weights and values reported transparently. The existing model provides a foundation for such refinements.

Country Annexes: USD 1B Fund

142 eligible Parties | State/IPLC: 50/50 | Pure IUSAF and three balance-point scenarios ranked by total allocation

This Annex provides country tables for the pure IUSAF allocation and the three balance point scenarios on a $1 billion fund. Additional annex tables at different fund volumes are available from the online repository.[31] These tables are automatically generated from the model data.

[31] See individual volume folders at: https://github.com/tierravivaai/cali-fund-allocation-model/tree/main/country-annexes

IUSAF (Pure)

Pure IUSAF allocation with band inversion, no TSAC or SOSAC

142 eligible Parties | Fund: USD 1B | State/IPLC: 50/50 | Gini: 0.0872 | IUSAF: 1000.0 M (100.0%), TSAC: 0.0 M (0.0%), SOSAC: 0.0 M (0.0%), LDC: 339.9 M, SIDS: 304.6 M.
